

Study: *Translational Biology of Pseudomyxoma Peritonei*

Robert C. Miller, MD

Mayo Clinic (Rochester, MN)

We have been able to identify a unique tissue and data resource to permit us to begin the comprehensive genomic analysis of pseudomyxoma peritonei tumors. We anticipate receiving our first results of genetic analysis in April, 2013. This information will permit us to begin exploring new models of targeted therapies for PMP tumors.

***This grant has provided a focus for us over the last year to form a center for the study of the translational biology of pseudomyxoma peritonei at the Mayo Clinic.
